

PRINT THIS AND TAKE IT TO YOUR DISTRIBUTOR OR INSTALLER

SP501 SMART GRID

Solar Hot Water System

Description: this is a SMART GRID System which can be coupled to your Surface Power solar systems. (*hot water, heating, Air conditioning, refrigeration*)

Operation: an interface unit connects to your system via your broadband which then connects to our SMART GRID services server in Florida, USA.

The interface module has a small charge at installation time but the service is FREE and you will see your system online with a customised user interface. It means we can also optimise your system, (*we don't bother you with details but your controller settings may be changed by our algorithm server*). This service is available for ALL Surface Power systems 24/7. (*Note, for commercial MPPTt real-time performance management, this service is mandatory*)(*it is also mandatory for all UK commercial Renewable Heat Incentive (RHI) systems so as to maximise metered output (MAX GOVERNMENT TARIFFS) using MPPTt*)

You can then track your system, or show it to the world through a dedicated website address on the Surface Power Smart Grid centre in Florida.
